

I wholeheartedly support t the Passive House initiatives in the draft three-year plan, including expanding the successful incentive and training programs in the current plan.

An affordable housing developer received PH incentives for a 39 unit development. It will radically change the carbon footprint of that development.

I also support the proposal of a 1-4 unit incentive program and a retrofit program, both based on Passive House. Low EUI incentives in new buildings are important, retrofit incentives a must.

To meet 2030 interim CECP and Roadmap goals, it is essential that we move towards net zero energy for all buildings and Passive House is the absolute bestway to achieve it. Passive House is based on fundamental building science principles and decades of practice, offering the quality, durability, verification, and assurance that the industry needs now to begin scaling up the production of healthy, net zero, and climate resilient buildings.

Thank Yoou

Bob Higgins-Steele
